

Why does the earth look the way it looks?

With a partner, review chapter two of your textbook to list at least 5 different answers as to why the earth looks the way it does today. Your reasons can and should include both natural and human causes.

Put your list of at least 5 answers on the left side of the construction paper I give you. Title the left side "Reasons why the earth looks the way it does."

On the right side of the same paper, draw a diagram of the earth that shows the items from your list. For example, if one reason you have listed is "Plate Tectonics" on the left side of the paper, your diagram of the earth on the right side should show different tectonic plates. Label the right side of your paper "Planet Earth".

Example of what your finished product should look like.

Grading:

Reasons listed 10 points

Diagram showing reasons 10 points

Total points = 20 points
